

AWS Elastic Beanstalk Deployment Report

This report explains deployment of a Node.js application using AWS Elastic Beanstalk for GitHub and academic documentation.

Project Overview

Elastic Beanstalk is a Platform as a Service that automates deployment, scaling, monitoring and management of web applications.

Objectives

Deploy Node.js app, learn PaaS, automate deployment, understand monitoring and cloud hosting.

Technologies Used

HTML, CSS, JavaScript, Node.js, Git, GitHub, AWS Elastic Beanstalk, EC2, IAM, Amazon Linux.

Deployment Steps

Create application, create environment, select Node.js platform, upload code, deploy, wait for healthy status, access application URL.

Benefits

Automatic infrastructure provisioning, health monitoring, scalability, simplified deployment and version management.

Future Scope

CI/CD, HTTPS, Auto Scaling, CloudWatch monitoring, database integration.

Conclusion

The project demonstrates practical AWS deployment skills suitable for GitHub portfolios and cloud engineer interviews.
